Positive outcome rates per group in the sex protected attribute

What's Driving the Model?

No SHAP data available.

GEMINI REPORT

AI-Generated Audit Findings

SUMMARY

The analysis of this model is critically incomplete. We were asked to check if the model is fair, but the report we received is missing the most important information: the 'fairness scores' that tell us how the model's decisions affect people of different races, sexes, and ages. This is like a safety inspection that doesn't check the brakes.

FAIRLENS

information simply missing. Using a model built on such incomplete data is risky and can lead to unreliable and potentially biased outcomes. Because of these fundamental issues, we cannot approve this model or trust it to make fair decisions. Our recommendation is to stop using the model immediately and conduct a proper, complete analysis, which includes calculating the missing fairness scores and fixing the data problems.

WHO IS AFFECTED

All protected groups are at high risk due to the incomplete audit and poor data quality.

Specifically, without fairness metrics, it is impossible to verify fair treatment for groups based on race (e.g., 'African-American', 'Caucasian'), sex ('Male', 'Female'), and age ('Less than 25', '25 - 45', 'Greater than 45').

ROOT CAUSE

The primary root cause is a failure in the model development and auditing lifecycle. Key fairness evaluation steps were omitted. 1. **Incomplete Audit Reporting**: The absence of standard fairness metrics (e.g., disparate impact, equalized odds) and model explainability data (SHAP values) makes it impossible to assess bias. 2. **Poor Data Hygiene**: The dataset contains extensive missing values for critical features (e.g., 'r_days_from_arrest', 'violent_recid'). The methods used to handle this

without feature importance analysis, it's impossible to determine if the model is using features that are highly correlated with protected attributes (e.g., geographic data acting as a proxy for race), which can perpetuate systemic biases.

STRATEGIC REMEDIATION PROTOCOL

01 **1. Halt Model Use:** Immediately halt any production deployment or use of this model for decision-making until a complete and transparent audit is conducted.

02 **2. Conduct Comprehensive Fairness Analysis:** Re-run the audit to generate and

Odds) for all protected groups.

03 **3. Perform Explainability Analysis:** Generate and analyze feature importance and SHAP values to understand which factors drive model predictions. Scrutinize top features for potential as proxies for protected attributes.

04 **4. Address Data Quality Issues:** Investigate the source of the missing data. Develop and document a robust strategy for data cleaning and imputation, and re-evaluate its impact on model fairness.

05 **5. Establish Governance Protocols:** Implement a mandatory, automated, and comprehensive fairness auditing protocol for all future model development, requiring that models pass predefined fairness thresholds before deployment.
